16

Exception Handling

It is common sense to take a method and try it. If it fails, admit it frankly and try another. But above all, try something.
—Franklin Delano Roosevelt

If they're running and they don't look where they're going I have to come out from somewhere and catch them.
—Jerome David Salinger

I never forget a face, but in your case I'll make an exception.
—Groucho Marx

OBJECTIVES

In this chapter you'll learn:

- What exceptions are and when to use them.
- To use `try`, `catch` and `throw` to detect, handle and indicate exceptions, respectively.
- To process uncaught and unexpected exceptions.
- To declare new exception classes.
- How stack unwinding enables exceptions not caught in one scope to be caught in another scope.
- To handle `new` failures.
- To use `auto_ptr` to prevent memory leaks.
- To understand the standard exception hierarchy.

Assignment Checklist

Name: _____ **Date:** _____

Section: _____

Exercises	Assigned: Circle assignments	Date Due
Prelab Activities		
Matching	YES NO	
Fill in the Blank	9, 10, 11, 12, 13, 14	
Short Answer	15, 16, 17

Coding Exercise	1	

Prelab Activities

Matching

Name: _____ **Date:** _____

Section: _____

After reading Chapter 16 of *C++ How to Program, Seventh Edition*, answer the given questions. These questions are intended to test and reinforce your understanding of key concepts and may be done either before the lab or during the lab.

For each term in the column on the left, write the corresponding letter for the description that best matches it from the column on the right.

	Term		Description
___	1. `catch` block	a)	Helps improve a program's fault tolerance.
___	2. `auto_ptr`	b)	Encloses the code that may generate an exception.
___	3. Exception handling	c)	Exception thrown when `new` fails.
___	4. `catch(...)`	d)	Indicates that a function does not throw exceptions.
___	5. `try` block	e)	Location in the program at which an exception occurs.
___	6. `bad_alloc`	f)	"Catch all" handler that catches any exception.
___	7. Throw point	g)	Encloses the code that is executed when an exception is caught.
___	8. `throw()`	h)	Class template that helps avoid memory leaks.

Prelab Activities

Name:

Fill in the Blank

Name: _____ **Date:** _____

Section: _____

Fill in the blank for each of the following statements:

9. When an exception is not caught in a program, function _____ is called.

10. Exception handling is designed for dealing with _____ errors (i.e., errors that occur as the result of a program's execution).

11. Typically, exception handling deals with errors in a different _____ from that which detected the error.

12. Class _____ is the base class for the exception hierarchy.

13. Once an exception is thrown, control cannot return directly to the _____.

14. _____ catches all exceptions.

Prelab Activities

Name:

Short Answer

Name: _____ **Date:** _____

Section: _____

In the space provided, answer each of the given questions. Your answers should be concise; aim for two or three sentences.

15. Describe two ways to detect memory allocation failures.

16. If an exception is thrown, but not caught in a particular function's scope, to what point does control return? What is the name for this process?

17. If an exception of type `X` is thrown, which catch handlers would be able to catch this exception?

Prelab Activities

Name:

Programming Output

Name: _____ **Date:** _____

Section: _____

For each of the given program segments, read the code and write the output in the space provided below each program. [*Note:* Do not execute these programs on a computer.]

18. What is output by the following program?

```
1  #include <iostream>
2  #include <string>
3  using namespace std;
4
5  // class DivideZero definition
6  class DivideZero {
7
8  public:
9
10    // constructor
11    DivideZero()
12       : out( "EXCEPTION: Division by zero attempted." )
13    {
14       // empty
15    } // end class DivideZero exception
16
17    // function display definition
18    string display() const
19    {
20       return out;
21    } // end function display
22 private:
23    string out;
24 }; // end class DivideZero
25
26 // function arithmetic definition
27 double arith( int n, int d )
28 {
29    if ( d == 0 )
30       throw DivideZero();
31
32    return static_cast< double > ( n ) / d;
33 } // end function arithmetic
34
35 int main()
36 {
37    try
38    {
39       cout << arith( 24, 6 ) << endl;
40       cout << arith( 1, 3 ) << endl;
41       cout << arith( 9, 0 ) << endl;
42    } // end try
```

Prelab Activities

Name:

Programming Output

```
43      catch ( DivideZero &e )
44      {
45         cout << e.display() << endl;
46      } // end catch
47   } // end main
```

Your Answer:

19. What is output by the following program?

```
1   #include <iostream>
2   #include <stdexcept>
3   using namespace std;
4
5   // function function3 definition
6   void function3() throw ( runtime_error )
7   {
8      throw runtime_error( "runtime_error in function3" );
9   } // end function function3
10
11  // function function2 definition
12  void function2() throw ( runtime_error )
13  {
14     function3();
15  } // end function function2
16
17  // function function1 definition
18  void function1() throw ( runtime_error )
19  {
20     try
21     {
22        function2();
23     } // end try
24     catch ( runtime_error e )
25     {
26        cout << "Exception occurred:\n" << e.what()
27             << "; caught in function1\n";
28        throw;
29     } // end catch
30  } // end function function1
```

Prelab Activities

Name:

Programming Output

```
31
32  int main()
33  {
34     try
35     {
36        function1();
37     } // end try
38     catch ( runtime_error &e )
39     {
40        cout << "Exception occurred:\n" << e.what()
41             << "; caught in main\n";
42     } // end catch
43  } // end main
```

Your answer:

Prelab Activities

Name:

Correct the Code

Name: _____ **Date:** _____

Section: _____

For each of the given program segments, determine if there is an error in the code. If there is an error, specify whether it is a logic error or a compilation error, circle the error in the program, and write the corrected code in the space provided after each problem. If the code does not contain an error, write "no error." [*Note*: It is possible that a program segment may contain multiple errors.]

20. The following program segment should `catch` two exception types thrown by `function1`.

```
try
{
   function1();
} // end try
catch ( runtime_error &r, DivideByZeroException &z )
{
   cout << "Exception( s ) occurred:\n" << r.what() << " and "
        << z.what() << "; caught in main\n";
} // end catch
```

Your answer:

Prelab Activities

Name:

Correct the Code

21. The following program segment should `catch` `runtime_errors`, `DividebyZeroExceptions` or any other exception thrown by `function2`.

```
try
{
   function2();
} // end try
catch ( ... )
catch ( runtime_error &r )
{
   cout << "Exception occurred:\n" << r.what()
} // end catch
catch ( DivideByZeroException &z )
{
   cout << "Exception occurred:\n" << z.what()
} // end catch
```

Your answer:

Lab Exercises

Lab Exercise 1— NumberVerifier

Name: _____ **Date:** _____

Section: _____

This problem is intended to be solved in a closed-lab session with a teaching assistant or instructor present. The problem is divided into six parts:

1. Lab Objectives
2. Description of the Problem
3. Sample Output
4. Program Template (Fig. L 16.1)
5. Problem-Solving Tips
6. Follow-Up Questions and Activities

The program template represents a complete working C++ program, with one or more key lines of code replaced with comments. Read the problem description and examine the sample output; then study the template code. Using the problem-solving tips as a guide, replace the `/* */` comments with C++ code. Compile and execute the program. Compare your output with the sample output provided. Then answer the follow-up questions. The source code for the template is available from the Companion Website for *C++ How to Program, Seventh Edition* at `www.pearsonhighered.com/deitel/`.

Lab Objectives

This lab was designed to reinforce programming concepts from Chapter 16 of *C++ How To Program, Seventh Edition*. In this lab, you will practice:

- Writing a class to determine whether a string contains digit characters.
- Using exception handling to handle non-numeric inputs.

The follow-up questions and activities also will give you practice:

- Using exception handling to handle inputs that are too large.
- Contrasting `catch` statements with `catch(...)` statements.

Problem Description

Write a short program that reads a number from the user and stores the number as a string of characters. Convert this string to an integer. Before conversion, test for a `NonNumber` exception, which occurs if one or more of the characters is not a digit. Your program should allow negative numbers.

Lab Exercises

Name:

Lab Exercise 1 — NumberVerifier

Sample Output

```
Please enter a number (end-of-file to terminate): 4
The number entered was: 4

Please enter a number (end-of-file to terminate): 28
The number entered was: 28

Please enter a number (end-of-file to terminate): -257
The number entered was: -257

Please enter a number (end-of-file to terminate): a23
INVALID INPUT: non-integer detected

Please enter a number (end-of-file to terminate): 34k3
INVALID INPUT: non-integer detected

Please enter a number (end-of-file to terminate): -3413-3
INVALID INPUT: non-integer detected

Please enter a number (end-of-file to terminate): -4-8
INVALID INPUT: non-integer detected

Please enter a number (end-of-file to terminate): ^Z
```

Template

```
1  // Lab 1: numberverifier.cpp
2  #include <iostream>
3  #include <cmath>
4  #include <string>
5  #include <stdexcept>
6  using namespace std;
7
8  // class NonNumber definition
9  class NonNumber : public runtime_error
10 {
11 public:
12    // constructor
13    NonNumber()
14       : runtime_error( "non-integer detected" )
15    {
16       // empty
17    } // end class NonNumber definition
18
19    /* write definition for member function what */
20 private:
21    string message;
22 }; // end class NonNumber
23
24 // function castInput definition
25 int castInput( string input )
26 {
27    int result = 0;
28    int negative = 1;
29
30    // check for minus sign
31    if ( input[ 0 ] == '-' )
32       negative = -1;
```

Fig. L 16.1 | numberVerifier.cpp. (Part 1 of 2.)

Lab Exercises

Name:

Lab Exercise 1— NumberVerifier

```
33
34     for ( int i = input.length() - 1, j = 0; i >= 0; i--, j++ )
35     {
36        if ( negative == -1 && i == 0 )
37           continue;
38
39        if ( input[ i ] >= '0' && input[ i ] <= '9' )
40           result += static_cast< int >( input[ i ] - '0' ) * pow( 10.0, j );
41        else
42           /* Write code to throw NonNumber exception */
43     } // end for
44
45     return result * negative;
46  } // end function castInput
47
48  int main()
49  {
50     string input;
51     int convert;
52
53     cout << "Please enter a number (end-of-file to terminate): ";
54
55     while ( cin >> input )
56     {
57        /* Write try block that calls castInput */
58        /* Write catch handler that catches any exceptions
59           that the call to castInput might have thrown */
60
61        cout << "\n\nPlease enter a number (end-of-file to terminate): ";
62     } // end while
63
64     cout << endl;
65  } // end main
```

Fig. L 16.1 | `numberverifier.cpp`. (Part 2 of 2.)

Problem-Solving Tips

1. To determine whether the input is a valid number, the program checks for any non-digit character in the input `string`. The only non-digit character that is allowed is a minus sign (-) at the beginning of the `string`.
2. Make sure that any code that could throw an exception is enclosed within a `try` statement with a matching `catch` handler.

Lab Exercises

Name:

Lab Exercise 1 — NumberVerifier

Follow-Up Questions and Activities:

1. Modify the program by creating an exception class `Overflow` for detecting whether the user input "fits" into an `int` variable. For the purpose of this exercise, any input longer than 10 digits should generate an overflow error. Modify function `castInput` to check for this error, and add an appropriate `catch` handler in `main` to handle this type of exception. A typical run of your program should look like this:

```
Please enter a number (end-of-file to terminate): 44
The number entered was: 44

Please enter a number (end-of-file to terminate): -44
The number entered was: -44

Please enter a number (end-of-file to terminate): p25
INVALID INPUT: non-integer detected

Please enter a number (end-of-file to terminate): 123456789
The number entered was: 123456789

Please enter a number (end-of-file to terminate): 12345678901
INVALID INPUT: overflow detected

Please enter a number (end-of-file to terminate): ^Z
```

2. In your solution to *Follow-Up Question 1*, replace the second `catch` with a `catch( ... )` statement. What changes occur?

Lab Exercises

Name:

Lab Exercise 2— Destructors

Name: _____ **Date:** _____

Section: _____

This problem is intended to be solved in a closed-lab session with a teaching assistant or instructor present. The problem is divided into five parts:

1. Lab Objectives
2. Description of the Problem
3. Sample Output
4. Program Template (Fig. L 16.2–Fig. L 16.4)
5. Problem-Solving Tips

The program template represents a complete working C++ program, with one or more key lines of code replaced with comments. Read the problem description and examine the sample output; then study the template code. Using the problem-solving tips as a guide, replace the `/* */` comments with C++ code. Compile and execute the program. Compare your output with the sample output provided. The source code for the template is available from the Companion Website for *C++ How to Program, Seventh Edition* at `www.pearsonhighered.com/deitel/`.

Lab Objectives

This lab was designed to reinforce programming concepts from Chapter 16 of *C++ How To Program, Seventh Edition*. In this lab, you will practice:

- Observing how destructors are called when an exception is thrown.

Problem Description

Write a program illustrating that all destructors for objects constructed in a block are called before an exception is thrown from that block.

Sample Output

```
TestObject 1 constructor
TestObject 2 constructor
TestObject 3 constructor

TestObject 3 destructor
TestObject 2 destructor
TestObject 1 destructor
This is a test exception
```

Lab Exercises

Name:

Lab Exercise 2— Destructors

Template

```
1  // Lab 2: TestObject.h
2  // Class TestObject definition.
3  class TestObject
4  {
5  public:
6     TestObject( int ); // constructor takes int parameter
7     ~TestObject(); // destructor
8  private:
9     int value;
10 }; // end class TestObject
```

Fig. L 16.2 | TestObject.h.

```
1  // Lab 2: TestObject.cpp
2  // Class TestObject member function definition.
3  #include <iostream>
4  using namespace std;
5
6  #include "TestObject.h"
7
8  // constructor takes int parameter
9  TestObject::TestObject( int val ) : value( val )
10 {
11    /* Write code to display a message announcing that this
12       constructor has been called, include data member value */
13 } // end TestObject constructor
14
15 // destructor
16 TestObject::~TestObject()
17 {
18    /* Write code to display a message announcing that this
19       destructor has been called, include data member value */
20 } // end TestObject destructor
```

Fig. L 16.3 | TestObject.cpp.

```
1  // Lab 2: destructors.cpp
2  #include <iostream>
3  #include <stdexcept>
4  using namespace std;
5
6  #include "TestObject.h"
7
8  int main()
9  {
10    try // create objects and throw exception
11    {
12       // create three TestObjects
13       /* Write declarations for three TestObjects */
14       cout << '\n';
```

Fig. L 16.4 | destructors.cpp. (Part 1 of 2.)

Lab Exercises

Name:

Lab Exercise 2— Destructors

```
15
16          // throw an exception to show that all three Objects created above
17          // will have their destructors called before the block expires
18          /* Write code to throw a runtime_error */
19       } // end try
20       /* Write a catch header to catch the runtime_error */
21       {
22          /* Write code to output the error message
23             to the standard error stream */
24       } // end catch
25    } // end main
```

Fig. L 16.4 | `destructors.cpp`. (Part 2 of 2.)

Problem-Solving Tips

1. Display a message inside the constructor and destructor of class `TestObject`.
2. Declare three `TestObjects` inside the `try` block. Their destructors will be called when the exception is thrown.
3. Have the `catch` block display a message so the user knows when the exception has been handled.

Lab Exercises

Name:

Debugging

Name: _____ **Date:** _____

Section: _____

The program (Fig. L 16.5) in this section does not run properly. Fix all the compilation errors so that the program will compile successfully. Once the program compiles, compare the output with the sample output, and eliminate any logic errors that may exist. The sample output demonstrates what the program's output should be once the program's code has been corrected.

Sample Output

```
Enter an integer from 1 to 100 (-1 to end): 54
Enter an integer from 1 to 100 (-1 to end): 12
54 / 12 = 4.5

Enter an integer from 1 to 100 (-1 to end): 93
Enter an integer from 1 to 100 (-1 to end): 32
93 / 32 = 2.90625

Enter an integer from 1 to 100 (-1 to end): a
Exception occurred: entered input of the wrong data type
Enter an integer from 1 to 100 (-1 to end): -4
Exception occurred: entered a number not in the valid range
Enter an integer from 1 to 100 (-1 to end): 132
Exception occurred: entered a number not in the valid range
Enter an integer from 1 to 100 (-1 to end): -1
An unknown exception has occurred, exiting the program
```

Broken Code

```
1  // Debugging: debugging.cpp
2
3  #include <iostream>
4  #include <exception>
5  using namespace std;
6
7  // class InvalidInputTypeException definition
8  class InvalidInputTypeException
9  {
10 public:
11    // constructor
12    InvalidInputTypeException()
13       : message( "entered input of the wrong data type" )
14    {
```

Postlab Activities

Coding Exercise

Name: _____ **Date:** _____

Section: _____

These coding exercises reinforce the lessons learned in the lab and provide additional programming experience outside the classroom and laboratory environment. They serve as a review after you have completed the *Prelab Activities* and *Lab Exercises* successfully.

For the following problem, write a program or a program segment that performs the specified action:

1. A `try` block contains a function call to `mystery` that could produce any of the following exceptions: `DivideByZeroException`, `InvalidInputException`, `ArithmeticException` or `InvalidCastException`. Class `ArithmeticException` is a base class of `DivideByZeroException`. Write the `try` block and necessary `catch` blocks. Add a `catch` block to handle all other possible exceptions.
